Typing Rule of Baremetalisp

Yuuki Takano ytakano@wide.ad.jp

May 12, 2020

1 Introduction

In this paper, I will formally describe the typing rule of Baremetalisp, which is a well typed Lisp for trusted execution environment.

2 Notation and Syntax

Table 1 and Fig. 1 shows notation used in this paper and syntax for the typing rule, respectively.

Listing 1: Example of variable and type

x is a variable. For example, $x \in \{a,b\}$ in Listing 1. \mathcal{T} is a type. For example, $\mathcal{T} \in \{ \text{Int}, (\rightarrow (\text{Int Int}) \text{ Int}) \}$ in Listing 1. $(\rightarrow (\text{Int Int}) \text{ Int})$ is a function type which takes 2 integer values and return 1 integer value. Pure in Listing 1 denotes the effect of the function but I just ignore it now. Function effects will be described in Sec. 4. \mathcal{T} can be other forms as described in Fig. 1 such as Bool, '(Int), [Bool Int], (List a), (List Int). C is a type constraint, which is a set of pairs of types. For example, $C = \{(\rightarrow (t_1 t_2) t) = (\rightarrow (\text{Int Int}) \text{ Int})\}$ deduced from Listing 1 means $(\rightarrow (t_1 t_2) t)$ and $(\rightarrow (\text{Int Int}) \text{ Int})$ are semantically equal and every type variable in C, t_1, t_2, t , is thus Int. Γ is a map from variable and label to type. For example, $\Gamma = \{a: t_1, b: t_2, +: (\rightarrow (\text{Int Int}) \text{ Int})\}$ in Listing 1. Γ is called context generally, thus I call Γ context in this paper.

Listing 2: Example of user defined data type

```
1 (data (List a)
2 (Cons a (List a))
3 Nil)
```

t is a type variable. For example, $t \in \{a\}$ in Listing 2. L is a label for user defined type. For example, $L \in \{\text{Cons}, \text{Nil}\}$ in Listing 2. D is user defined data. For example, $D \in \{\text{List}\}$ in Listing 2. Γ will hold mapping from labels in

```
Table 1: Notation
                          expression
                    e
                          integer literal such as 10, -34, 112
                          variable
                    \boldsymbol{x}
                          type variable
                    t
                          type name of user defined data
                   D
                    L
                          label of user defined data
                   \mathcal{T}
                          type
                   C
                          type constraint
                    Γ
                          context
                   \mathcal{P}
                          pattern
                \mathcal{P}_{let}
                          pattern of let expression
        \mathcal{T}_1 \equiv_{\alpha} \mathcal{T}_2
                          \mathcal{T}_1 and \mathcal{T}_2 are \alpha-equivalent
       \mathcal{S}:t \to \mathcal{T}
                          substitution from type variable to type
              \mathcal{T}\cdot\mathcal{S}
                          apply S to T
                          set of t
 FV_{\mathcal{T}}: \mathcal{T} \to \mathcal{X}
                          function from \mathcal{T} to its free variables
  FV_{\Gamma}:\Gamma\to\mathcal{X}
                          function from \Gamma to its free variables
Size:L\to {\tt Int}
                          the number of labels L's type has
\Gamma \vdash e : \mathcal{T} \mid_{\mathcal{X}} C
                          e's type is deduced as \mathcal T from \Gamma
                          under constraint C and type variables \mathcal{X}
```

addition to variables. For example, $\Gamma = \{\text{Cons} : (\text{List } a), \text{Nil} : (\text{List } a), \text{Cons}_{1st} : a, \text{Cons}_{2nd} : (\text{List } a)\}$ in Listing 2.

 $FV_{\mathcal{T}}$ and FV_{Γ} are functions, which take \mathcal{T} and Γ and return free variables. For example, $FV_{\mathcal{T}}((\to (t_1 \ t_2) \ t)) = \{t_1, t_2, t\}$ and

```
\begin{split} FV_{\Gamma}(\{a:t_1,b:t_1,+:(\rightarrow \texttt{(Int Int) Int)}\}) \\ &= \{FV_{\mathcal{T}}(t_1),FV_{\mathcal{T}}(t_1),FV_{\mathcal{T}}((\rightarrow \texttt{(Int Int) Int)})\} \\ &= \{t_1,t_2\}. \end{split}
```

 $\mathcal{T}_1 \equiv_{\alpha} \mathcal{T}_2$ denotes that \mathcal{T}_1 and \mathcal{T}_2 are α -equivalent, which means \mathcal{T}_1 and \mathcal{T}_2 are semantically equal. For example, $(\rightarrow (t_1 \ t_2) \ t) \equiv_{\alpha} (\rightarrow (t_{10} \ t_{11}) \ t_{12})$. \mathcal{S} is a substitution, which is a map from type variable to type, and it can be applied to \mathcal{T} as $\mathcal{T} \cdot \mathcal{S}$. For example, if $\mathcal{S}(t_1) = [\text{Bool Int}], \mathcal{S}(t_2) = (\text{List } t_3)$ then $(\rightarrow (t_1 \ t_2) \ t) \cdot \mathcal{S} = (\rightarrow ([\text{Bool Int}] \ (\text{List } t_3)) \ t)$.

Listing 3: Example of pattern matching

 \mathcal{P} and \mathcal{P}_{let} are pattern in match and let expressions. For example, in listings 3, (Just val) and Nothing at line 9 and 12 are from \mathcal{P} and (Dim2 x y) at line 10 is from \mathcal{P}_{let} . Size is a function which takes a label and return the number of labels the label's type has. For example, Size(Just) = Size(Nothing) = 2 because Maybe type has 2 labels and Size(Dim2) = 1 because Dim2 type has 1 label in listings 3.

- 3 Typing Rule
- 4 Effect

$$\begin{split} \Gamma \vdash \text{true} : \text{Bool} \mid_{\varnothing} \varnothing \quad & (\text{T-True}) \qquad \Gamma \vdash \text{false} : \text{Bool} \mid_{\varnothing} \varnothing \quad & (\text{T-False}) \\ \frac{x : T \in \Gamma}{\Gamma \vdash x : T \mid_{\varnothing} \varnothing} \quad & (\text{T-Var}) \qquad \Gamma \vdash z : \text{Int} \mid_{\varnothing} \varnothing \quad & (\text{T-Num}) \\ \Gamma \vdash \mathcal{P}_{let} : \mathcal{T}_0 \mid_{\mathcal{A}_0} C_0 \quad \Gamma \vdash e_1 : \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \Gamma \vdash e_2 : \mathcal{T}_2 \mid_{\mathcal{X}_2} C_2 \\ \frac{\mathcal{X}_0 \cap \mathcal{X}_1 \cap \mathcal{X}_2 = \varnothing}{\Gamma \vdash (\text{lett}} \mathcal{P}_{let} e_1 e_2) : \mathcal{T}_2 \mid_{\mathcal{X}_0 \cup \mathcal{X}_1 \cup \mathcal{X}_2} C \qquad & (\text{T-Let1}) \\ \hline \Gamma \vdash (\text{lett}} \mathcal{P}_{let} e_1 e_2) : \mathcal{T}_2 \mid_{\mathcal{X}_0 \cup \mathcal{X}_1 \cup \mathcal{X}_2} C \qquad & (\text{T-Let1}) \\ \hline \Gamma \vdash e_1 : \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \Gamma \vdash e_2 : \mathcal{T}_2 \mid_{\mathcal{X}_2} C_2 \quad \Gamma \vdash e_3 : \mathcal{T}_3 \mid_{\mathcal{X}_3} C_3 \\ \hline \mathcal{X}_1 \cap \mathcal{X}_2 \cap \mathcal{X}_3 = \varnothing \quad C = C_1 \cup C_2 \cup C_3 \cup \{\mathcal{T}_1 = \text{Bool}, \mathcal{T}_2 = T_3\} \\ \hline \Gamma \vdash (\text{if} \ e_1 \ e_2 : \mathcal{T}_2 \mid_{\mathcal{X}_2} C_2 \wedge \cdots \wedge \Gamma \vdash e_n : \mathcal{T}_n \mid_{\mathcal{X}_n} C_n \\ \hline \mathcal{T} \vdash e_1 : \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \Gamma \vdash e_2 : \mathcal{T}_2 \mid_{\mathcal{X}_2} C_2 \wedge \cdots \wedge \Gamma \vdash e_n : \mathcal{T}_n \mid_{\mathcal{X}_n} C_n \\ \hline \mathcal{T} \vdash (\text{if} \ e_1 \ e_2 : \mathcal{T}_2 \mid_{\mathcal{X}_2} C_2 \wedge \cdots \wedge \Gamma \vdash e_n : \mathcal{T}_n \mid_{\mathcal{X}_n} C_n \\ \hline \mathcal{T} \vdash \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \Gamma \vdash e_2 : \mathcal{T}_2 \mid_{\mathcal{X}_2} C_2 \wedge \cdots \wedge \Gamma \vdash e_n : \mathcal{T}_n \mid_{\mathcal{X}_n} C_n \\ \hline \mathcal{T} \vdash \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \Gamma \vdash e_2 : \mathcal{T}_2 \mid_{\mathcal{X}_2} C_2 \wedge \cdots \wedge \Gamma \vdash e_n : \mathcal{T}_n \mid_{\mathcal{X}_n} C_n \\ \hline \mathcal{T} \vdash \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \Gamma \vdash e_2 : \mathcal{T}_2 \mid_{\mathcal{X}_2} C_2 \wedge \cdots \wedge \Gamma \vdash e_n : \mathcal{T}_n \mid_{\mathcal{X}_n} C_n \\ \hline \mathcal{T} \vdash \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \Gamma \vdash e_2 : \mathcal{T}_2 \mid_{\mathcal{X}_2} C_2 \wedge \cdots \wedge \Gamma \vdash e_n : \mathcal{T}_n \mid_{\mathcal{X}_n} C_n \\ \hline \mathcal{T} \vdash \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \cap \mathcal{T}_1 \cap \cdots \cap \mathcal{T}_n = \varnothing \\ \hline \mathcal{T} \vdash \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \quad \mathcal{T}_1 \mid_{\mathcal{X}_1} C_1 \cap \mathcal{T}_1 \cap \cdots \cap \mathcal{T}_n \cap \mathcal{T}_n$$
